## 8. Test Validity

### 8.1. Test Validity for the 2010 Mod-MSA: Mathematics

As noted in the Standards for Educational and Psychological Testing (AERA, APA, \& NCME, 1999), "validity is the most important consideration in test evaluation."

Messick (1989) defined validity as follows:

> Validity is an integrated evaluative judgment of the degree to which empirical evidence and theoretical rationales support the adequacy and appropriateness of inferences and actions based on test scores or other modes of assessment. (p.5)

This definition implies that test validation is the process of accumulating evidence to support intended use of test scores. Consequently, test validation is a series of ongoing and independent processes that are essential investigations of the appropriate use or interpretation of test scores from a particular measurement procedure (Suen, 1990).
In addition, test validation embraces all of the experimental, statistical, and philosophical means by which hypotheses and scientific theories can be evaluated. This is the reason that validity is now recognized as a unitary concept (Messick, 1989).
To investigate the validity evidence of the 2010 Mod-MSA: Mathematics, content-related evidence, evidence from item development methods, bias review evidence during test development and for items that showed differential item functioning (DIF), and evidence from internal structure were collected. Also, a study comparing the mode of administration was undertaken by Pearson to validate the online administration of the test.

## Content-Related Evidence

Content validity is frequently defined in terms of the sampling adequacy of test items. That is, content validity is the extent to which the items in a test adequately represent the domain of items or the construct of interest (Suen, 1990). Consequently, content validity provides judgmental evidence in support of the domain relevance and representativeness of the content in the test (Messick, 1989).

Evidence regarding the alignment between the content in the 2010 Mod-MSA: Mathematics and the standards of achievement set by MSDE are provided in Appendix E that links each item to the specific standard(s) it measures. Information on the item composition of the operational test forms can be obtained from Section 2.6 Items Selected for the 2010 Operational Tests. The selected items are displayed in Appendix A with their UIN numbers.

## Evidence from Item Development Methods

Test development for Mod-MSA: Mathematics is ongoing and continuous. Content specialists, teachers from across Maryland, Pearson, and MSDE were greatly involved in developing and reviewing items. Committees such as content review, bias review, and vision review reviewed all of the items, which were finally stored in a Maryland item bank. Specifically, an internal review by MSDE and Pearson staff for content alignment and quality necessitated a great deal of time and energy. More specific information on item (test) development and review can be obtained in Section 2, Test Design and Development of the 2010 Mod-MSA: Mathematics while the standards to which the items were aligned can be obtained from the MSDE website at: http://mdk12.org/instruction/curriculum/index.html

As explained in Section 2.4 to 2.6, once these items were scored, MSDE and Pearson conducted additional item analysis and content review to select items for the operational form, i.e., the form on which the student scores would be reported. Any item that exhibited statistical results that suggested potential problems were carefully reviewed by both MSDE and Pearson content specialists. A determination was then made as to whether an item should be eliminated, revised, or field-tested again.

## Evidence Based on Excluding Bias Items Before and After DIF Analysis

One important consideration in evaluating the validity of a test is to examine the equity of each item performance between groups of interest. As explained in Section 2.2, all items went through a bias review committee to ascertain that items were not biased with respect to gender, ethnicity, geographical location, etc. Also, as explained in Section 2.4, after items were scored, DIF analysis was undertaken and those items that showed moderate or significant DIF were reviewed for bias with respect to gender, and ethnicity (white and black students). More information on DIF analyses can be obtained in Section 2.4, Differential Item Functioning.

Items that had moderate or extreme DIF are depicted in Table 8.1.1, below. These items for the Mod-MSA; Mathematics were checked for content bias, but did not show favoritism on the basis of gender or ethnicity (black vs. white students).

Table 8.1.1. Category Classification of Items that Showed Moderate or Extreme DIF by Grades

| Grade | Item Sequence No. ${ }^{1}$ | Item CID No. | DIF Classification ${ }^{2}$ |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Gender | White/AfricanAmerican |
| 3 | 5 | 100000098439 | +B | A |
|  | 11 | 100000197780 | A | +B |
|  | 15 | 100000197753 | +B | A |
|  | 24 | 100000197617 | A | +B |
|  | 25 | 100000197603 | A | +B |
|  | 31 | 100000197651 | A | -B |
|  | 36 | 100000197779 | A | +B |
|  | 56 | 100000197660 | -B | A |
|  | 61 | 100000197649 | -B | A |
|  | 62 | 100000197650 | A | +B |
|  | 66 | 100000197665 | A | -B |
|  | 70 | 100000197746 | A | -B |
|  | 72 | 100000197750 | A | -C |
|  | 90 | 100000197740 | A | -B |
|  | 93 | 100000185385 | +B | A |
|  | 97 | 100000185388 | A | +B |

|  | 89 | 100000272162 | A | -B |
| 7 | 6 | 100000272217 | -B | A |
|  | 10 | 100000322136 | +B | A |
|  | 11 | 100000322138 | A | +B |
|  | 12 | 100000197496 | A | +B |
|  | 16 | 100000099488 | A | -B |
|  | 19 | 100000322152 | A | -B |
|  | 39 | 100000374152 | A | -B |
|  | 61 | 100000272187 | A | +B |
|  | 71 | 100000099504 | +B | A |
|  | 73 | 100000167818 | A | -B |
|  | 89 | 100000322157 | A | -B |
|  | 96 | 100000322162 | -B | A |
| 8 | 25 | 100000322208 | A | -B |
|  | 33 | 100000272368 | A | -B |
|  | 34 | 100000322200 | +B | A |
|  | 35 | 100000099626 | A | -B |
|  | 38 | 100000286786 | -C | A |
|  | 47 | 100000322117 | -C | A |
|  | 52 | 100000272353 | +B | A |
|  | 57 | 100000322206 | A | -B |
|  | 78 | 100000373854 | -B | -B |
|  | 86 | 100000272303 | -B | A |

Note: $1 .{ }^{\prime}+$ ' $=$ in favor of the reference group, i.e. males and White Americans while ' ${ }^{\prime}$ ' $=$ in favor of the focal group. Extreme $\overline{\mathrm{DIF}}=$ "C", Moderate DIF $=$ "B", and No DIF is classified as an "A".
2. These analyses are based on the equating sample used with the exclusion criterion

## Evidence from Internal Structure of the Tests

As explained in Section 2.3, the 2010 Mod-MSA: Mathematics contains five mathematics reporting strands: Algebra, Geometry and Measurement, Statistics and Probability, Numbers and Computation, and Process. Even though these are individual strands are "locally independent," they measure the same underlying mathematics trait. Therefore, the positive correlation among these strands is an indication of their relationship with each other in measuring the same underlying construct. To ascertain the homogeneity of the test, correlations were calculated to depict the relationship between each strand within a grade. Tables 8.1.2 through 8.1.7 show the correlations among the mathematics strands for each of the three grades 3 through 8 , respectively.

Table 8.1.2. The 2010 Mod-MSA, Math Strand (Cluster) Correlations: Grade 3

| Strand (Subscale) | $\mathbf{N}$ | Mean | $\mathbf{S D}$ | $\mathbf{A}$ | $\mathbf{G M}$ | $\mathbf{S P}$ | $\mathbf{N C}$ | $\mathbf{P}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Algebra (A) | 669 | 4.79 | 1.91 | 1.00 |  |  |  |  |
| Geometry and Measurement (GM) | 669 | 5.64 | 2.20 | 0.50 | 1.00 |  |  |  |
| Statistics and Probability (SP) | 669 | 4.62 | 2.05 | 0.42 | 0.42 | 1.00 |  |  |
| Numbers and Computation (NC) | 669 | 5.89 | 2.45 | 0.52 | 0.57 | 0.49 | 1.00 |  |
| Process (P) | 669 | 4.47 | 2.01 | 0.46 | 0.50 | 0.42 | 0.51 | 1.00 |

Note. The restriction of the range of scores on the strands could have resulted in the attenuation of the correlation coefficients between any two modalities.

Table 8.1.3. The 2010 Mod-MSA, Math Strand (Cluster) Correlations: Grade 4

| Strand (Subscale) | $\mathbf{N}$ | Mean | $\mathbf{S D}$ | $\mathbf{A}$ | $\mathbf{G M}$ | $\mathbf{S P}$ | $\mathbf{N C}$ | $\mathbf{P}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Algebra (A) | 872 | 5.06 | 2.05 | 1.00 |  |  |  |  |
| Geometry and Measurement (GM) | 872 | 5.07 | 2.04 | 0.48 | 1.00 |  |  |  |
| Statistics and Probability (SP) | 872 | 5.62 | 2.34 | 0.51 | 0.47 | 1.00 |  |  |
| Numbers and Computation (NC) | 872 | 5.45 | 2.19 | 0.55 | 0.47 | 0.54 | 1.00 |  |
| Process (P) | 872 | 5.02 | 2.04 | 0.46 | 0.46 | 0.47 | 0.47 | 1.00 |

Note: The restriction of the range of scores on the strands could have resulted in the attenuation of the correlation coefficients between any two modalities.

Table 8.1.4. The 2010 Mod-MSA, Math Strand (Cluster) Correlations: Grade 5

| Strand (Subscale) | $\mathbf{N}$ | Mean | $\mathbf{S D}$ | $\mathbf{A}$ | $\mathbf{G M}$ | $\mathbf{S P}$ | $\mathbf{N C}$ | $\mathbf{P}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Algebra (A) | 926 | 5.31 | 2.10 | 1.00 |  |  |  |  |
| Geometry and Measurement (GM) | 926 | 4.56 | 1.87 | 0.38 | 1.00 |  |  |  |
| Statistics and Probability (SP) | 926 | 4.22 | 1.91 | 0.51 | 0.40 | 1.00 |  |  |
| Numbers and Computation (NC) | 926 | 4.47 | 1.95 | 0.46 | 0.36 | 0.45 | 1.00 |  |
| Process (P) | 926 | 5.62 | 2.21 | 0.41 | 0.32 | 0.47 | 0.36 | 1.00 |

Note. The restriction of the range of scores on the strands could have resulted in the attenuation of the correlation coefficients between any two modalities.

| Process (P) | 1846 | 6.26 | 2.18 | 0.39 | 0.25 | 0.32 | 0.29 | 1.00 | 1017 | 5.68 | 2.33 | 0.49 | 0.31 | 0.49 | 0.38 | 1.00 |

Note. The restriction of the range of scores on the strands could have resulted in the attenuation of the correlation coefficients between any two modalities.

## Evidence of Equity in the Modes of Administration

See Appendix G: Comparison of Paper-Pencil Version with the On-Line Version of the Maryland Modified School Assessment (Mod-MSA) in Reading and Mathematics (Grades 4 and 5) that justifies the use of online testing both as a total test across the two modes of administration and also in the bias-examination of each item's performance across the modes of administration.

### 8.2. Unidimensionality Analysis for the 2010 Mod-MSA: Mathematics

Measurement implies order and magnitude on a single dimension (Andrich, 1989). Consequently, in the case of scholastic achievement, this requires a linear scale to reflect this idea of measurement. Such a test is considered to be unidimensional (Andrich, 1988, 1989).
However, unidimensionality cannot be strictly met in a real testing situation because students' cognitive, personality, and test-taking factors usually have a unique influence on their test performance to some level (Andrich, 1988; Hambleton, Swaminathan, \& Rogers, 1991). Consequently, what is required for unidimensionality to be met is an investigation of the presence of a dominant factor that influences test performance. This dominant factor is considered as the proficiency measured by the test (Andrich, 1988; Hambleton et al., 1991; Ryan, 1983).

To check the unidimensionality of the 2010 Mod-MSA: Mathematics, correlation coefficients were computed with LISREL 8.5 (Jöreskog \& Sörbom, 1993). Principal component analysis was then applied to produce eigenvalues. The first and the second principal component eigenvalues were compared without rotation. Table 8.2.1 summarizes the results of the first and second principal component eigenvalues of the 2010 Mod-MSA: Mathematics. As shown in the table, the first factor extracted a much large amount of eigenvalues across all grades.

Table 8.2.1. Eigenvalues between the First and Second Components of the Mod-MSA:
Mathematics

| Grade | First <br> Eigenvalue | Second <br> Eigenvalue |
| :---: | :---: | :---: |
| 3 | 9.77 | 2.25 |
| 4 | 9.19 | $2 . .09$ |
| 5 | 7.40 | 1.82 |
| 6 | 8.77 | 2.46 |
| 7 | 6.98 | 2.77 |
| 8 | 7.41 | 2.16 |

Note. Analyses were conducted with the statewide population after applying equating exclusion criteria.
